Glottometrics

Glottometrics ist eine unregelmäßig erscheinende Zeitschrift (2-3 Ausgaben pro Jahr) für die quantitative Erforschung von Sprache und Text.

Beiträge in Deutsch oder Englisch sollten an einen der Herausgeber in einem gängigen Textverarbeitungssystem (vorrangig WORD) geschickt werden.

Glottometrics kann aus dem **Internet** heruntergeladen werden (**Open Access**), auf **CD-ROM** (PDF-Format) oder als **Druckversion** bestellt werden.

Glottometrics is a scientific journal for the quantitative research on language and text published at irregular intervals (2-3 times a year).

Contributions in English or German written with a common text processing system (preferably WORD) should be sent to one of the editors.

Glottometrics can be downloaded from the **Internet (Open Access)**, obtained on **CD-ROM** (as PDF-file) or in form of **printed copies**.

Runes: complexity and distinctivity 1-16

Abstract. Complexity of several types of runes is investigated using the composition method introduced by Altmann (2004). First models for distributions of components and connections are suggested. Letter distinctivity is studied.

Nadia Yesypenko

Writer's voice in the texts of "Peace and War" themes 17-26

Abstract. The article deals with the study of lexical semantic peculiarities of writer's voice in the novels of modern English and American literature. The statistical approach adopted in the present study is combined with the componential analysis of the word-stock in the novels and set in a linguistic framework that prioritizes lexis and semantics. The study investigates semantic verb classes that are very frequent in the analyzed novels. The lexical statistical approach to the data involves a comparative analysis of the usage of semantic verb classes in the novels of war versus peace theme.

Karl-Heinz Best

Word length in Persian 27-30

Abstract. The aim of this paper is to show that word lengths in some Persian texts follow the 1-displaced Hyperpoisson distribution. The findings lend support to the theory of word length distributions (Wimmer et alii 1994, Wimmer & Altmann 1996) once more.

Ioan-Iovitz Popescu, Gabriel Altmann

Zipf's mean and language typology 31-37

Abstract. Zipf's law is not only an expression of the rank-frequency relationship of words but it also enables us to make statements about some morphological features of language, too. In the present study, several indicators are proposed and their mutual relations are studied. The data are taken from 20 languages.

Nora Heinicke

Wortlängenverteilungen in französischen Briefen eines Autors 38-45

Abstract. Earlier studies examining regularities in texts of modern French came to the result that the frequency with which words of different lengths are used in texts can be described by the Hirata-Poisson distribution. This study aims to clarify whether this rule also applies to letters written by the French author Charles Baudelaire in the 19th century. Furthermore this paper analyses whether the letters are homogeneous regarding the distribution of their word lengths.

Emmerich Kelih

Modelling polysemy in different languages: A continuous approach 46-56

Abstract. This paper investigates the frequency of polysemy in six genetically unrelated languages. It can be shown that these distributions can be described by a power model, developed by the Estonian

linguist Juhan Tuldava. Furthermore, interrelations between descriptive parameters of the analyzed empirical distributions have been obtained. Special attention has been paid to the behaviour of the parameters of the theoretical models, taking into account different influence factors (language analyzed, sample size, parts of speech).

Marina Knaus

Zur Verteilung rhythmischer Einheiten in russischer Prosa 57-62

Abstract. The purpose of this paper is to present some further evidence for the validity of the well-known law concerning the distribution of language entities of different lengths in texts. To this end it is shown that in 20 Russian texts of Tolstoj the length of rhythmic units abides by the 1-displaced binomial distribution.

Solomija Buk, Ján Mačutek, Andrij Rovenchak

Some properties of the Ukrainian writing system 63-79

Abstract. We investigate the grapheme–phoneme relation in Ukrainian and some properties of the Ukrainian version of the Cyrillic alphabet.

**Zuzana Martináková, Ioan-Iovitz Popescu,
Ján Mačutek, Gabriel Altmann**

Some problems of musical texts 80-110

Abstract. The aim of this article is to find fixed points and regularities in musical texts, set up statistical tests for their comparison and observe their development. The analysis is based on rank-frequency distributions of pitches. The following indicators are described: the *h*-point and its angle, the *a*-indicator, the *H*-point and the *H*-coverage having an affinity to the golden section, and the *A*-ratio. Different curves capturing the trends are proposed. The analysis has been performed on 266 compositions of 12 European composers from Palestrina to Ligeti.

Peter Grzybek, Emmerich Kelih, Ernst Stadlober

The relation between word length and sentence length:
an intra-systemic perspective in the core data structure 111-121

Abstract. Word length and sentence length are systematically organized in texts and corpora. In recent attempts at the synergetic modeling of the relation between sentence length and word length, the importance of distinguishing intra-textual from inter-textual approaches has been emphasized. The present study focuses on the intra-textual level: with a particular emphasis on different text types, it is shown, under which conditions processes of inter-level self-regulation are operative, and when they fail to be efficient.
