

# **Computer Simulation of Production Processes**

by

Martin Pollák

Petr Baron

Marek Kočiško

Monika Telišková

The monograph was reviewed by the following reviewers.

prof. Ing. Jozef Svetlík, PhD.  
Ing. Imrich Orlovský, PhD.  
Ing. Tomáš Schlosser

Edition of Scientific and Technical Literature

|   |           |
|---|-----------|
| <b>INTRODUCTION.....</b>  | <b>1</b>  |
| <br>  |           |
| <b>1. Computer Simulation.....</b>                                | <b>2</b>  |
| 1.1 History of Computer Simulation.....                           | 2         |
| 1.2 Introduction to Simulation.....                               | 3         |
| 1.2.1 Computer simulation application capabilities .....          | 6         |
| 1.2.2 Simulation project phases.....                              | 8         |
| 1.2.3 Simulation options.....                                     | 10        |
| <br>  |           |
| <b>2. Computer Simulation of Production Systems .....</b>         | <b>14</b> |
| 2.1 Fundamentals of Systems Theory .....                          | 14        |
| 2.2. Systems Classification .....                                 | 16        |
| 2.2.1 Dynamic systems .....                                       | 16        |
| 2.3 Dynamic Systems Modeling and Simulation .....                 | 19        |
| 2.3.1 Basic concepts of modeling and simulation.....              | 20        |
| 2.3.2 Modeling and simulation of continuous dynamic systems ..... | 21        |
| 2.3.3 Modeling and simulation of discrete dynamic systems.....    | 22        |
| 2.4 Random Numbers.....   | 23        |
| 2.4.1 Transforming random numbers into random variables .....     | 23        |
| <br>  |           |
| <b>3. Basic Concepts of Production System Simulation.....</b>     | <b>30</b> |
| 3.1 Manufacturing Process Structure.....                          | 32        |
| 3.2. Production Systems Modeling .....                            | 34        |
| 3.3 Queuing Systems Simulation .....                              | 37        |
| 3.4. Simulation of Material Flow Systems .....                    | 39        |
| 3.5 Simulation of Inventory Systems.....                          | 39        |
| 3.6 Simulation of Failure Systems .....                           | 41        |

|  |           |
|--|-----------|
| <b>4. Simulation Systems.....</b>  | <b>43</b> |
| 4.1 Simulation Software .....  | 43        |
| 4.2 History of Simulation Software .....                                     | 44        |
| 4.3 Simulation Software Selection and Requirements.....                      | 45        |
| 4.4 Overview of the Selected Simulation Software .....                       | 46        |
| <br>   |           |
| <b>5. Creation in the Simulation Environment of the Witness System .....</b> | <b>49</b> |
| 5.1 Witness Simulation Software.....   | 49        |
| 5.2 Layout Window.....   | 50        |
| 5.3 Element Sector .....   | 50        |
| 5.4 Designer Elements.....   | 51        |
| 5.5 Simulation Clock .....   | 51        |
| 5.6 Simulation Control.....  | 51        |
| 5.7 Creating a simulation project in the Witness program.....                | 52        |
| 5.8 Basic Functional Elements of the Model .....                             | 52        |
| 5.8.1 Part.....  | 53        |
| 5.8.2 Buffers .....  | 54        |
| 5.8.3 Machine .....  | 56        |
| 5.8.4 Failures (downtime) modelling - Breakdowns .....                       | 57        |
| 5.8.5 Machine setup .....  | 59        |
| 5.8.6 Labor.....   | 59        |
| 5.9 Random Numbers in the Witness System.....                                | 60        |
| 5.10 Conveyance Systems .....  | 63        |
| 5.10.1 Conveyors.....  | 63        |
| 5.10.2 Path.....   | 65        |
| 5.10.3 Vehicles .....  | 66        |
| 5.10.4 Tracks .....  | 68        |
| 5.10.5 Unloading .....   | 69        |
| 5.10.6 Loading.....  | 70        |
| 5.11 Work Shifts.....  | 71        |

|  |            |
|--|------------|
| 5.12 Input and Output Rules .....  | 73         |
| 5.12.1 Input rules .....   | 73         |
| 5.12.2 Output rules .....  | 74         |
| 5.12.3 Input-output rules .....  | 74         |
| 5.13 Attributes .....  | 76         |
| 5.14 Variables.....  | 77         |
| 5.15 Description of Work in the Witness Simulation System on Practically Demonstrated Examples (Example 1) ..... | 78         |
| 5.16 Description of Work in the Witness Simulation System on Practically Demonstrated Examples (Example 2) ..... | 92         |
| 5.17 Description of Work in the Witness Simulation System on Practically Demonstrated Examples (Example 3) ..... | 105        |
| <br>   |            |
| <b>6. Computer Simulation of Plastic Injection Molding Process.....</b>  | <b>118</b> |
| 6.1 Technological Process of Plastic Injection Molding .....   | 119        |
| 6.2 Computer Simulation of the Process of Filling the Mold Cavity with Molten Polymer .....                      | 122        |
| <br>   |            |
| <b>7. Analysis of the Technical Process of Plastic Injection in PTC Creo Mold Analysis .....</b>                 | <b>139</b> |
| 7.1 Viewing Analysis Results in the Mold Analysis Environment.....   | 148        |
| 7.2 Report Generation on the Simulations Applied .....   | 162        |
| 7.3 Application of Computer Simulation to Design of the Plastics Injection Mold's Shape Parts.....               | 165        |
| 7.4 Application of the PTC Creo Mold Design Module to Designing Shape Parts of the Mold.....                     | 171        |
| <br>   |            |
| <b>8. Machining Technologies and Simulation in CA Systems .....</b>  | <b>178</b> |
| 8.1 Procedure for Manufacturing a Part in a CAD/CAM Systems .....  | 178        |
| 8.2 Turning in the CAM System .....  | 182        |
| 8.3 Milling in the CAM System .....  | 183        |
| 8.4 Verification and Simulation .....  | 185        |

|   |            |
|---|------------|
| <b>9. Special Software Types for NC Program Verification .....</b>      | <b>189</b> |
| 9.1 NX System.....  | 189        |
| 9.1.1 Production aid by NX system.....                                  | 190        |
| 9.1.2 NX workshop documentation .....                                   | 193        |
| 9.1.3 NX editing options for automatically generated documentation..... | 199        |
| 9.1.4 NX CAM System.....  | 210        |
| 9.2 Creo System.....  | 216        |
| 9.2.1 Creo aided production.....  | 219        |
| 9.2.2 Workshop documentation in Creo .....                              | 222        |
| 9.3 VERICUT System .....  | 231        |
| 9.4 Catia System .....  | 232        |
| 9.4.1 Catia aided production .....                                      | 236        |
| 9.4.2 Workshop documentation in the Catia environment .....             | 238        |
| 9.5 NCSIMUL System .....  | 240        |
| 9.5.1 NCSIMUL MACHINE.....  | 241        |
| 9.5.2 NCSIMUL 4CAM.....   | 242        |

## **INTRODUCTION**

Nowadays, manufacturing companies are forced to adapt to new conditions by flexibly responding to different customers' and their clients' demands. Simulation can be applied to various existing systems, validations, and analyzes, machine and equipment utilization, personnel availability, capacity requirements for detection of bottlenecks, design of manufacturing systems, analysis of existing systems, as well as production management concept verification. Today's simulation programs can simulate the entire production process in a matter of minutes, uncover its deficiencies, or evaluate the production-associated costs. Simulation is a reliable tool for gathering progress and production process results that provide a wealth of data to help managers make the right decisions quickly and easily.

Computer simulation is characterized by the fact that in a few hours, it can run experiments that take several days or months on real systems. The simulation answers the questions like "What happens when?", "Where are the main risks?", "Where does the system have its bottlenecks?"

This process is associated with the effects of predicting the behavior of the system under assessment, supporting decision-making at different levels, better understanding of the system's function and its gradual improvement, saving money and, ideally, eliminating the potential risks in the human-machine environment.

Although a computer-based expertise approach cannot replace a human element in the management process, or a complex system management, its application, naturally subject to managing the initial cost of acquiring a simulation system, its installation and successful application is associated with a number of positive benefits, ranging from financial cost savings for the operators of the systems under assessment, to environmental aspects and aspects of technical and humane workplace safety.
