CONTENTS

CONTENTS	1
INTRODUCTION	6
1 INDUSTRIAL ENGINEERING	1
1.1 Science and Engineering	1
1.2 Industrial engineering.....	3
1.3 Process Principles in Manufacturing	7
1.4 Enterprise engineering (Cooperative engineering).....	8
2 METHODS OF INDUSTRIAL ENGINEERING	16
2.1 TQM – Total Quality Management	16
2.2 JIT – Just-in-time.....	17
2.3 BPR – Business Process Reengineering	17
2.4 Six Sigma methodology	18
2.5 Lean philosophy	19
2.6 Continuous improvement	22
2.7 Single-Minute Exchange of Die (Quick changeover).....	23
2.8 BPM – Business Process Management.....	23
3 IMPORTANCE OF CORPORATE INFORMATION SYSTEMS WITHIN THE PLANNING OF CORPORATE PROCESSES	25
3.1 Corporate process modelling.....	25
3.1.1 Model of a corporate process	28
3.2 Business System Planning	29
3.2.1 Preparatory stage	29
3.2.2 Analytical part	30
3.2.3 Application part.....	34
3.3 Corporate information systems	35
3.3.1 Structured approach to information system creation.....	39
3.4 Object-oriented approaches to the preparation of an information system....	47
3.4.1 Object-oriented design.....	49
3.4.2 Object modeling technique	50
3.4.3 Comparison of specific and object-oriented approach to the creation of information systems of the company	51
3.5 Architecture of Integrated Information Systems	52
3.6 Kanban.....	54
3.6.1 Online Kanban	56
3.7 Overall Equipment Effectiveness (OEE)	59
4 INNOVATION	61
4.1 What is innovation.....	61
4.2 Types of Innovation.....	61
4.3 Standardization as a driving force for innovation	66

5 PLANNING, DESIGN AND IMPROVEMENT OF PROCESSES.....	68
5.1 Procedures of planning and improving internal company processes	68
5.2 Procedure used to define a labour-organisational system	76
5.3 System characteristic used to define a labour-organisational system.....	77
5.4 Design and planning of processes.....	82
5.5 Application of procedures to selected processes.....	84
6 TRENDS IN THE INDUSTRIAL MANUFACTURING.....	94
6.1 Trends.....	94
6.2 Digital and virtual engineering.....	98
6.3 New business opportunities and models.....	99
7 BUSINESS MODELS.....	103
7.1 Modern production systems	103
7.2 Generic model for strategic structure adaptations.....	103
7.3 Stuttgarter Unternehmens modell	104
7.4 CIMOSA infrastructure	106
7.5 Reconfigurable Manufacturing Systems.....	107
7.6 Intelligent integrated manufacturing systems	108
7.7 Cyber-physical systems	109
8 SYSTEMS ENGINEERING	111
9 MODELING AND SIMULATION	118
9.1 Characteristics of terms related to modeling and simulation	121
9.2 Computer modelling and simulation	125
10 MODELING IN INDUSTRIAL ENGINEERING	130
10.1 Theory of models	132
10.2 Classification of models	134
10.3 Modeling stages.....	135
10.4 Creating the model.....	138
11 POSITION OF MODELLING IN INDUSTRIAL ENGINEERING IN RELATION TO ANALYSED PRO CESS AND ERRORS IN THE MEASUREMENT AND PROCESSING STAGES.....	139
11.1 Errors in the measurement and processing stages	140
11.1.1 Measurement errors and their distribution	142
11.1.2 Testing of errors and possibilities of their reduction.....	143
11.1.3 Subjective measurement errors	144
12 METHODS OF EXPERIMENTAL MODELING	147
Theory of experimental modelling and its relation to industrial engineering	155

13 STAGES IN EXPERIMENTAL MODELING	174
13.1 Experiment design	174
13.2 Realization of measurement	181
13.3 Processing of measurement results	185
13.4 Experiment evaluation and assessment.....	185
14 MODELLING THE DESIGN, MANAGEMENT, PERFORMANCE AND IMPROVEMENT OF PRODUCTION SYSTEMS.....	186
14.1 Model of production system	186
14.2 Analysis of production systems and its phases.....	195
14.2.1 Design of production systems.....	195
14.2.2 Management of production systems.....	197
14.2.3 Measurement of production systems performance.....	200
14.2.4 Improving the performance of production systems	201
14.3 Model options.....	203
14.4 Model of production system design and its analysis	207
14.5 Models of production systems management.....	209
14.5.1 Basic APP model.....	210
14.5.2 Basic model extension.....	212
14.5.3 Scheduling of production	213
14.6 Types of production systems management.....	218
14.7 Supply chain management.....	221
14.8 Performance modelling and production system improvement.....	227
15 MARKETING AND MANAGEMENT AS A MODELLING OBJECT.....	245
15.1 Marketing strategy and its creation	246
15.2 Simulation models in marketing and management	259
15.3 Creation of simulation model.....	261
15.4 Evaluation of computer simulation and modelling	261
16 LOGISTICS AS A MODELING OBJECT	263
16.1 Definition, functions and scheme of company logistics	263
16.2 Logistic functions.....	268
16.3 Modeling of logistics chain	270
16.4 Supply logistics	273
16.5 Production logistics	275
16.6 Warehouse logistics	281
16.7 Distribution logistics	288
17 SIMULATION IN INDUSTRIAL ENGINEERING	294
17.1 Classification of computer simulations	296
17.2 Modern tools for simulation experimentation.....	297
17.3 Advantages and disadvantages of simulation	301
17.4 Identifying areas using simulations	302

18 MODELLING AND SIMULATION OF PRODUCTION SYSTEMS	304
18.1 Causal and acausal modelling	304
18.2 Modelling and simulation of complex systems	305
18.3 Objectives of models and simulations	306
18.4 Types of models.....	306
19 PLM (PRODUCT LIFECYCLE MANAGEMENT) SYSTEMS	310
19.1 PLM characteristic.....	311
19.2 Functions of PLM systems	314
19.3 Basic elements of PLM philosophy	316
19.4 Description of advantages of PLM systems	317
19.5 Siemens PLM portfolio	318
19.5.1 NX products.....	319
19.5.2 Velocity Series.....	320
19.5.3 Teamcenter.....	321
19.6 Simulation software solutions.....	322
19.7 Process Simulate Modules.....	324
19.7.1 Process Simulate Assembly	325
19.7.2 Process Simulate Human	325
19.7.3 Process Simulate Spot Weld	325
19.7.4 Process Simulate Robotics.....	325
19.7.5 Process Simulate Virtual Commissioning	326
19.8 Simulation options in the Process Simulate environment.....	329
19.8.1 Event-based simulation basics	329
19.8.2 Unique event-based simulation abilities.....	331
19.8.3 Cyclic Event Evaluator – CEE	331
19.9 PLM systems and selected software modules	332
19.9.1 Tx Plant Simulation.....	338
19.9.2 Tx Process Designer module.....	339
19.9.3 Tx Process Simulate module	341
19.9.4 FactoryCAD	344
19.9.5 FactoryFLOW	345
19.9.6 RobCAD	346
19.9.7 Tx Jack & Jill.....	346
19.9.8 Teamcenter – data management of control systems	351
and business processes	351
19.10 Digital enterprise	354
20 TECNOMATIX PROCESS SIMULATE VIRTUAL COMMISSIONING, ENVIRONMENT AND TOOLS USED TO DESIGN MANUFACTURING SYSTEMS	358
20.1 Project creation process.....	358
20.2 Description of the modelled workplace.....	367
20.3 Creating kinematics of individual components of the production line	370
20.3.1 Creation of CNC lathe kinematics.....	370
20.3.2 Creating a kinematic table	375
20.3.3 Creating the kinematics of fixtures.....	377
20.3.4 Creating a conveyor.....	379
20.3.5 Logic Blocks – Smart Component.....	383

20.3.6 Creating a logical block for a robot carrier	384
20.3.7 Creating a logical block for a CNC lathe	390
20.3.8 Automatically create a logical block for a rotary table	391
20.3.9 Automatic creation of logical block for fixtures	393
20.3.10 Establishing a connection of the rotary table to the fixtures	394
20.3.11 Creating sensors.....	395
20.3.12 Creation of material flow	397
21 INDUSTRY 4.0 AND SIMULATION TRENDS.....	398
21.1 Industry 4.0	398
21.2 The concept of Industry 4.0.....	402
21.3 Use of the digital twin concept	409
CONCLUSION	417
REFERENCES.....	418

INTRODUCTION

The presented monograph deals with the implementation of procedure, modelling and simulation of production systems within industrial and digital engineering.

The major part of the monograph is aimed at the issue of company production processes, i.e. modelling and simulation in particular. These processes are analysed and planned with assistance of chosen software modules to create a link between a digital image of production and real in-house production process. Actual debugging of line programmes takes place in a digital environment of a suitable application in connection with specialized components which generate signals and behaviour of objects instead of the production line. This revolutionary solution enables us to prevent collisions and errors in projects much sooner, even before production halls are constructed. Currently, when production companies seek to minimize their costs of production or costs of production implementation or possible changes of production, the application of new PLM systems becomes an inseparable part of a modern company. PLM systems cover management and control operations of all processes within product life cycle. The necessity to track a product from its plan and design, through production planning to actual production guaranteed that standards are followed which, eventually, gave rise to a unique system that uses sophisticated software tools to control and manage data concerning a given product. Advantages of the use of PLM system outweigh initial costs of its implementation. Modelling and simulation of a manufacturing process means to create a digital image of how the production looks and which activities are performed within the production. Additional analyses or simulation of a manufacturing process might expose potential errors in the process, bottlenecks etc. PLM systems could as well be used for virtual commissioning. This technology enables detailed digitalisation of production, focused on a product or production equipment, and subsequent simulation of a required production process according to project documentation. Such simulation in a PLM system environment results in a ready programme for a company production line. This saves time necessary for testing and debugging of operations on the production line after commissioning in the production hall. Time savings come even in an initial point of planning, when a number of errors and collisions may be exposed which might occur during actual production.

Introduction

The presented monograph is divided into 21 chapters following each other. These chapters provide theoretical as well as practical information on modelling, simulation and PLM systems in connection with real implementation of I 4.0 in industrial practice.

Authors

This monograph was prepared with financial support of the following projects

APVV-17-0258 *Digital engineering elements application in innovation and optimization of production flows*

VEGA 1/0708/16 *Development of new research methods to simulate, review, evaluate and quantify advanced manufacturing methods*

KEGA 030TUKE-4/2017 *Implementation of innovative tools for the increase of quality in the university education within the field of study 5.2.52 Industrial engineering*
